### Claims 1-3

Documents 1 and 2 neither describe nor suggest a brush mounting structure for an automatic cutting machine, in which (1) brushes for a cutting support face have projections in plural rows on the backs of their base portions, (2) the said projections are engaged with a brush mount in such a manner that they can be disengaged and moved, (3) locking projections having engaging faces more secure in hooking degree than the engaging faces of the projections provided in the rows of the rear side, as locking faces, are formed in the rows of the front side, and (4) locking ribs having locking faces more secure in hooking degree than the engaging faces of engaging ribs are formed opposite to the locking faces of the locking projections of the said brushes.

Box No. VII Certain defects in the international application

The following defects in the form or contents of the international application have been noted:

Claim 1 describes "a load in a specific direction perpendicular to the movable direction on the said brush mount," but the specific perpendicular direction can be either of two directions. So, the direction referred to is not clear.
